

Servicing your Lightning eMotors Fleet

One of the key variables to any successful commercial electric vehicle deployment is how is your fleet going to be serviced. While EVs generally require far less maintenance than their internal combustion engine counterparts, they do require periodic inspections and maintenance to keep them running optimally.

Lightning eMotors offers several options for service designed to meet the specific needs of any fleet.

Train your service team

Many fleets today have their own dedicated service team in house. These skilled mechanics likely have years of experience working on ICE vehicles but maintaining an EV may be new to them. The good news is that much of the work they would normally perform is the same. EVs need ball joints, tires, brakes (albeit much less frequently) just like ICE vehicles.

Beyond standard chassis upkeep, maintaining EV uptime is relatively straight forward. We can train your team on all aspects of maintaining your Lightning fleet from required tooling, safety, component replacement, and inspections quickly and easily. Of course, our direct service team is always just a phone call or email away if your team has additional questions.

Service through a certified Lightning eMotors service partner

If you don't have a home-grown maintenance team, working with one of our national certified service partners would be a great option. These partners have facilities throughout the US and have been trained on all aspects of EV maintenance and repair. By working with one of our OEM trained partners, you can rest assured that any repair needs your fleet may have are in good hands.

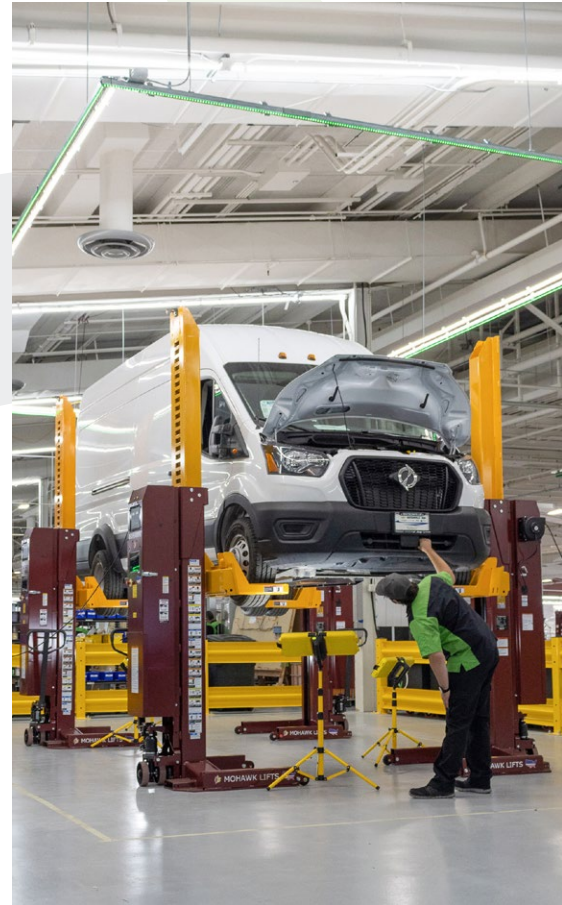

Train your preferred service provider

Much like the option of having Lightning train an in-house maintenance crew, we can also work with your preferred local service providers to ensure they have the tools and training needed to keep your fleet on the road. Most local providers appreciate the opportunity to be trained on the latest technology to keep their skills current.

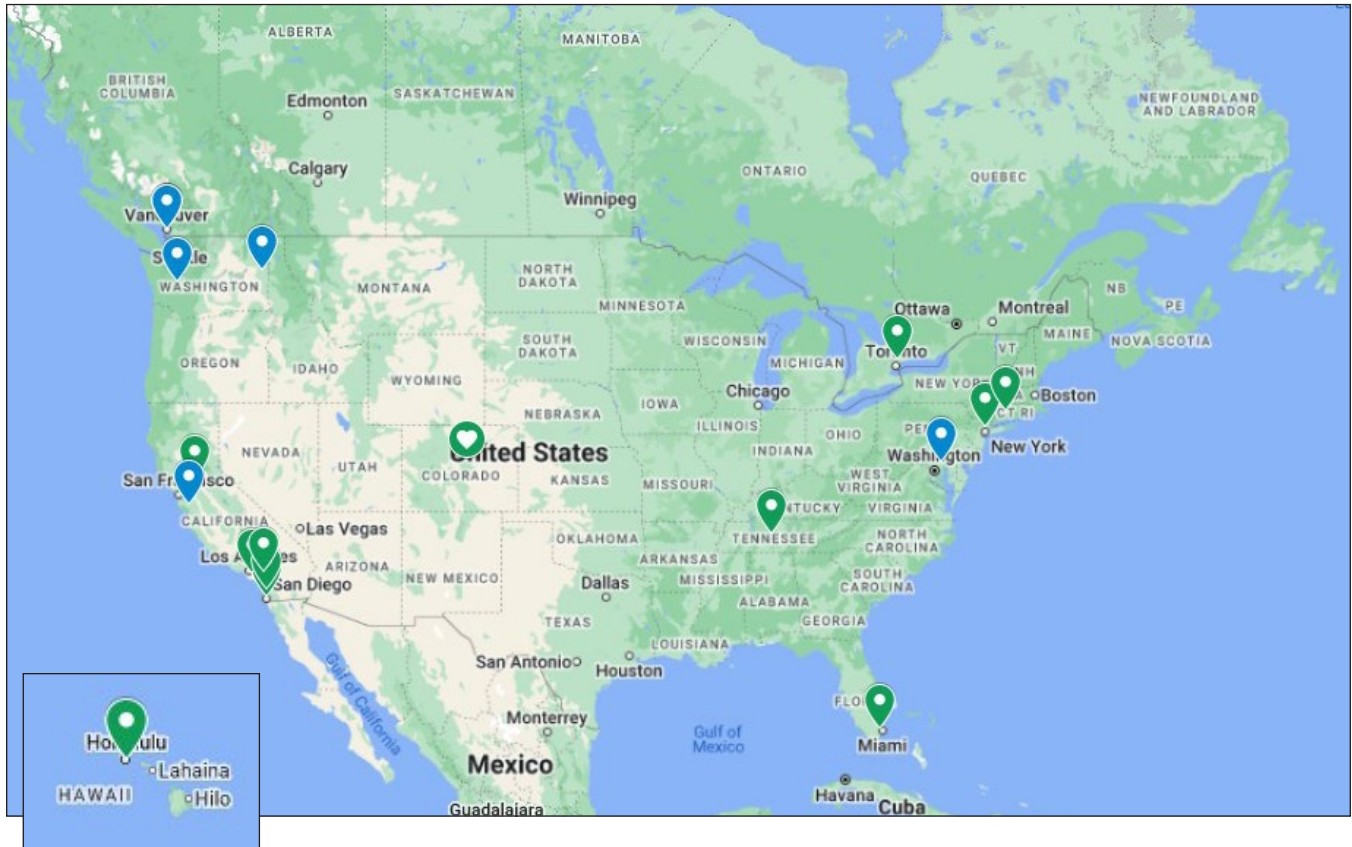

Lightning Service Direct

If none of the above options works for your situation, Lightning is able to provide repair services on our vehicles with our own highly trained service crew. Simply contact our service department via phone or email and we will arrange to have a regional service technician visit your facility to perform the required work.
